Python Introduction

FCCs

First Class Citizens →

→ does not have any primitive data types

int

strings ....

No memory limitations. (RAM)

→ compiler → 01 01.. → CPU

→ JAVA, C++ ...

→ interpreter → CPU

python, JS ...

FCCs → int, string, bool } ← implement data types

everything in python is an object → bool

int

string

f(x)

class

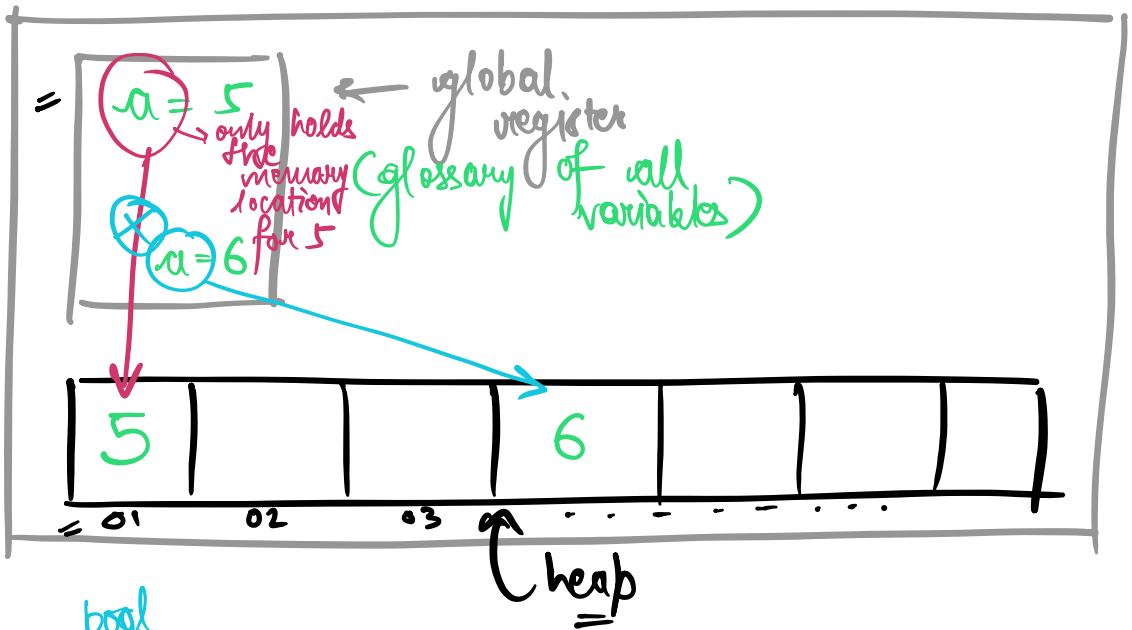
Mutable v/s Immutable

→ can be changed

→ a = 5

→ a = 6

immutable



bool

only mutable data structures in python are LISTS, SETS & DICTIONARIES

int, float, str — immutable.

Iteration

- for → iterables
- while

a = "python"

iterator ← a → iterable

```
for x in a:
    print(x)
```

iteration block

Iteration Protocol

```
a = "python"
it = iter(a)
next(it)
```

iterator
